# Reflections on Bayesian analysis to support landscape ecological risk assessment in the Upper Grande Ronde Watershed of INLAS

Wayne G. Landis-Huxley College of the Environment, Western Washington University, Bellingham WA

# Fire is more than a local impact

The sun in the middle of the afternoon near Burlington Washington-smoke from hundreds of miles away and last several days.

Being on the boarder we get it from California, Oregon, Alaska, British Columbia and occasionally from Asia.

#### Short Introduction....thanks to the USFS

Our application of Bayesian Networks grew out of a program funded by Joint Venture Agreement No. PNW 06-JV-11261900–070 with the U.S. Department of Agriculture, Forest Service, Pacific Northwest Research Station.

Terry Shaw facilitated the program and when we said that we wanted to start using Bayesian Networks-he said that this guy down the hall uses them all the time so ok. Of course, that person was Bruce G. Marcot and my research took a different path.....

#### Short Introduction....

Forestry Management has multiple management goals and fire is only one of them.

Bayesian networks allow a number of questions about "current states" and then a number of "what if" questions and management alternatives.

The methods in this talk have now been applied for the cleanup of toxic sites, disease prediction, synthetic biology, invasive species and other types of questions.

#### Short Introduction....

#### **Conventional Relative Risk Model**

Human and Ecological Risk Assessment: An International Journal, 18: 946–970, 2012 Copyright © Taylor & Francis Group, LLC ISSN: 1080-7039 print / 1549-7860 online DOI: 10.1080/10807039.2012.707925

#### **RISK ASSESSMENT ARTICLES**

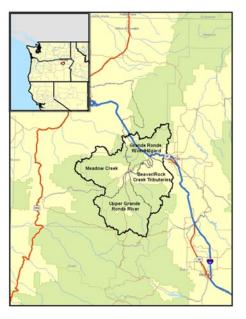

A Bayesian Approach to Landscape Ecological Risk Assessment Applied to the Upper Grande Ronde Watershed, Oregon

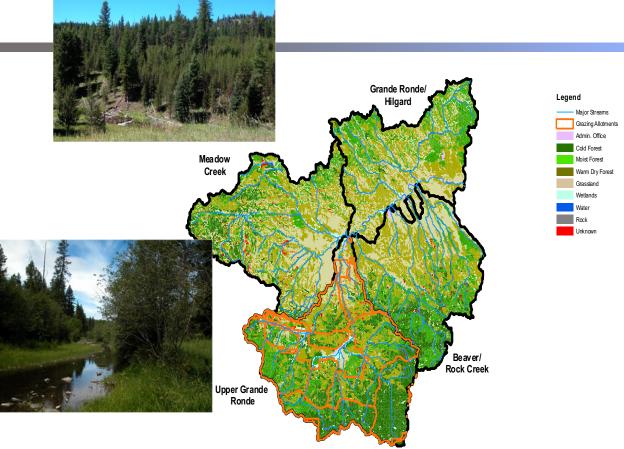

#### Kimberley K. Ayre and Wayne G. Landis

Institute of Environmental Toxicology, Huxley College of the Environment, Western Washington University, Bellingham, WA, USA

#### Our first application of Bayesian networks

## The study area.....

#### Risk Assessment Structure and Causal Pathway

Based on Landis and Wiegers 1997, 2005.

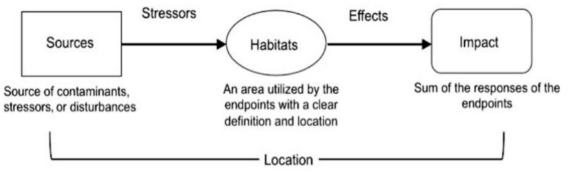

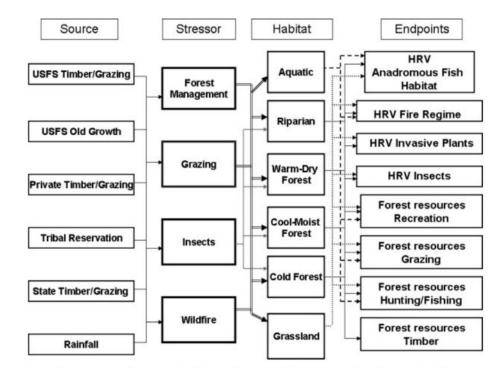

Figure 1. Diagram of the fundamental RRM conceptual model for regional risk assessment.

#### Anderson and Landis 2012

# Risk Assessment Structure and Causal Pathway

- Directed Acyclic graph
- Nodes
- Lines of influence
- Categorical
- Probabilistic

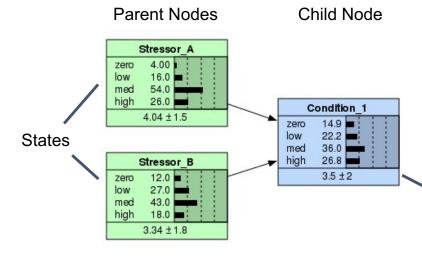

**Figure 4.** Conceptual model. Complete pathways are indicated with connecting lines. The same model is used for each risk region although the ranks and filters are altered specifically for each calculation.

#### Bayesian Network Structure

- Nodes represent variables
  - Parent node has no input variables
  - Child node has input from other variables
- Variables are assigned discrete states
  - Zero, low, medium, and high
  - Similar to treatment with relative risk model
- Structure reflects causality
  - Based on conceptual model developed by Suzanne Anderson

# **Bayesian Network Relative Risk Model**

# The methods have been published for other sites and a variety of stressors:

#### **Conditional Probability Table**

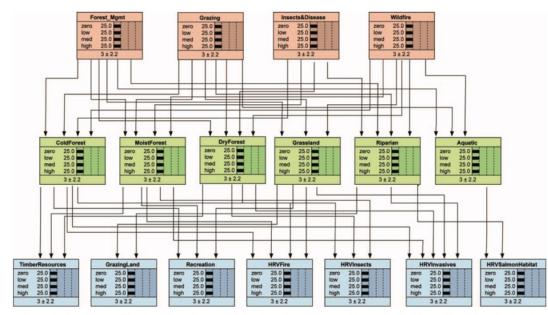

| Stressor_A | Stressor_B | zero   | low    | med    | high   |
|------------|------------|--------|--------|--------|--------|
| zero       | zero       | 100.00 | 0.000  | 0.000  | 0.000  |
| zero       | low        | 90.000 | 8.000  | 1.500  | 0.500  |
| zero       | med        | 75.000 | 20.000 | 4.000  | 1.000  |
| zero       | high       | 60.000 | 25.000 | 10.000 | 5.000  |
| low        | zero       | 75.000 | 20.000 | 4.000  | 1.000  |
| low        | low        | 50.000 | 35.000 | 10.000 | 5.000  |
| low        | med        | 25.000 | 35.000 | 30.000 | 10.000 |
| low        | high       | 10.000 | 30.000 | 45.000 | 15.000 |
| med        | zero       | 25.000 | 35.000 | 30.000 | 10.000 |
| med        | low        | 10.000 | 30.000 | 45.000 | 15.000 |
| med        | med        | 5.000  | 25.000 | 50.000 | 20.000 |
| med        | high       | 1.000  | 9.000  | 40.000 | 50.000 |
| high       | zero       | 15.000 | 25.000 | 40.000 | 20.000 |
| high       | low        | 10.000 | 15.000 | 35.000 | 40.000 |
| high       | med        | 5.000  | 10.000 | 30.000 | 55.000 |
| high       | high       | 1.000  | 4.000  | 20.000 | 75.000 |

## **Conditional Probabilities**

- Link parent and child nodes
- Value of child node is dependent upon the likelihood of states for all parent nodes
- Conditional probabilities established through spatial analysis of GIS data for all parent node variables

# Why Bayesian Networks?

- 1. Combine different types of data including model predictions and expert judgment
- 2. Uncertainty is inherently reflected in the probability distributions
- 3. Updateable when new information or knowledge comes available
- 4. Can be used to predict <u>both</u> input and output variable states

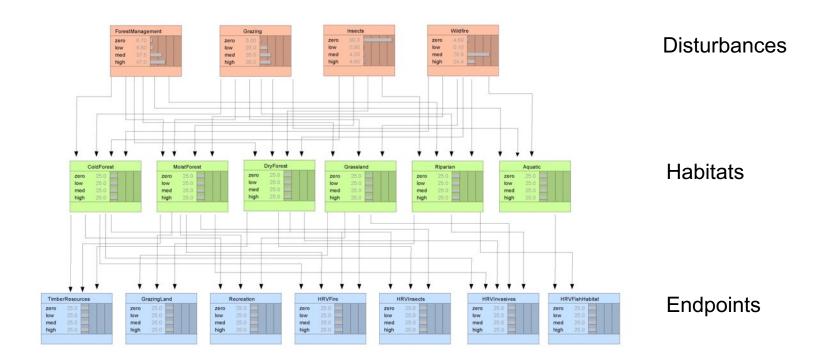

A slight rearrangement.

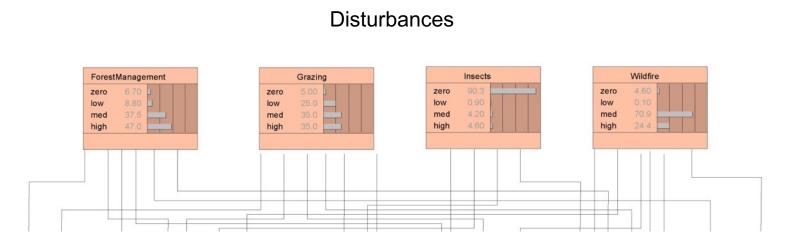

The inputs are now on the top row, the outcomes (impacts) are on the bottom-

Parameterized using the extensive datasets and expert knowledge of the USFS.

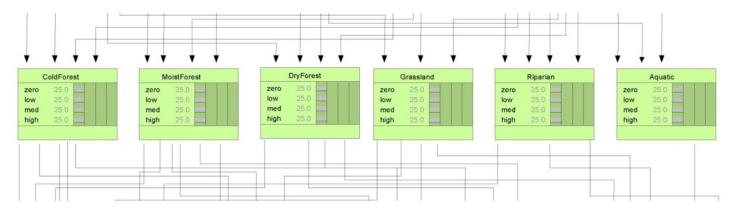

**Figure 3.** Bayesian network model developed for the analysis of ecological risk from landscape disturbances in the upper Grande Ronde watershed in northeastern Oregon. The top parameter nodes in the diagram repre-

Ayre and Landis 2012

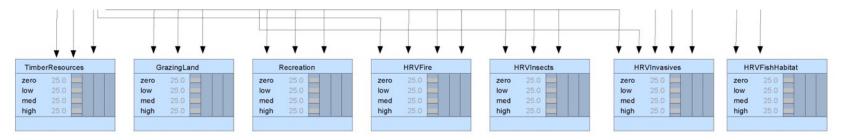

Note the distributions....the inputs have been incorporated into the Parent Nodes

Habitats/Locations

Note the even distributions....model is not yet compiled. Left out in the examples to come.

#### Endpoints-to be managed

Note the even distributions....model is not yet compiled.

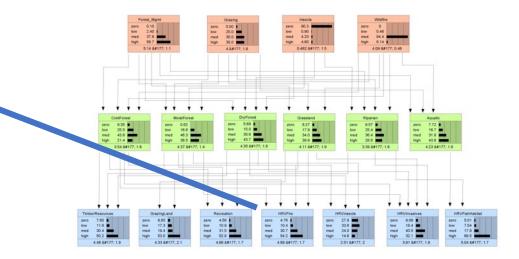

HRV-Historic Range of Variation Interesting criterion in the time of climate change

Real distributions....model is compiled.

- Risk rankings calculated as the mean state of the probability distribution
- Expressed ± standard deviation for the probability distribution-but note that they do not look like Gaussian distributions, but many seem to like seeing them.
- Output represents the likely range of risk ranks

# Risk Ranks initial risk assessment

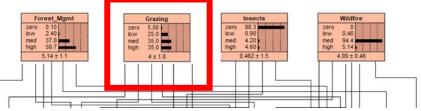

Range of risk values-note the distributions

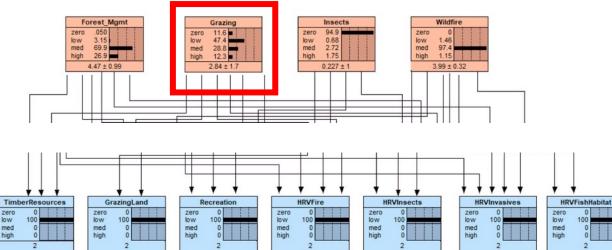

### Solving the Model "Backwards"

- Set endpoint risk values to desired risk level
- Model automatically updates values of parent parameters need to achieve desired risk level
- Can the parameters be managed in such a pattern?
- Which endpoint has a priority, what if questions.

# Low Risk for each endpoint....

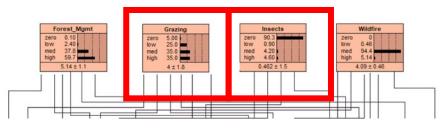

#### Low risk each endpoint

Low risk each endpoint-Grazing has the largest change

# Why do all this analysis? OODA Loops

#### Observe, Orient, Decide and Act—Loop

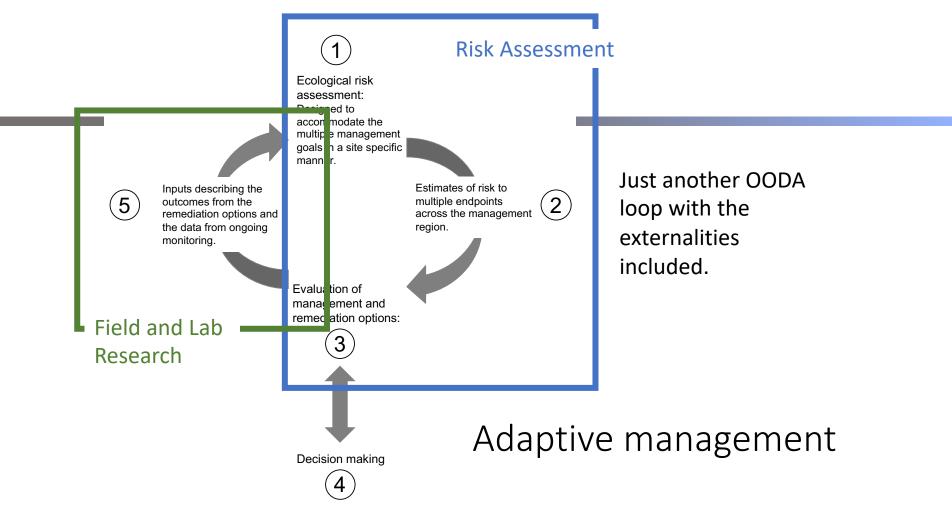

"OODA.Boyd" by Patrick Edwin Moran -Own work. Licensed under CC BY 3.0 via Wikimedia Commons http://commons.wikimedia.org/wiki/File: OODA.Boyd.svg#/media/File:OODA.Boyd. svg

#### Adaptive management-Landis 2017

Just another OODA loop with the externalities included.

responsible parties, local, regional, national and international agencies

# Why Bayesian networks?....

- Adaptable—Fire and lots more
- Multiple stressors are normal and can be calculated
- Interactions of management methods can be evaluated
- Pictures and numbers...
- Warning—risks do not always go down together like in this example.

#### Thanks for your time.....
